Trove as a pervasive game

What is it

Why develop it

How does it work

Achievements

What's next

sOC-EUSAI Grenoble 2005

Trove

- ? an example of pervasive / physical gaming from the SENSORIUM suite
- ? based around the MICA2 & TinyOS system

sOC-EUSAI Grenoble 2005

Why was it developed

- ? Main thrust was to excite and facilitate understanding of some basic pervasive/distributed systems concepts
 - Bringing the pervasive agenda to undergraduates
 - Allow for undergraduate work in a controlled environment – facilitate creative thinking and problem solving
 - Gives scope to student work in a wide range of timely disciplines from within computing
- ? Gave an opportunity to appropriately address a mostly computing-disinterested teens market
- ? Test rig for research

sOC-EUSAI Grenoble 2005

How does it work

- ? Distributed and controllerless – all game play within motes
- ? Collaborative – motes communicate for collective game rules
- ? UI is simply a listener

sOC-EUSAI Grenoble 2005

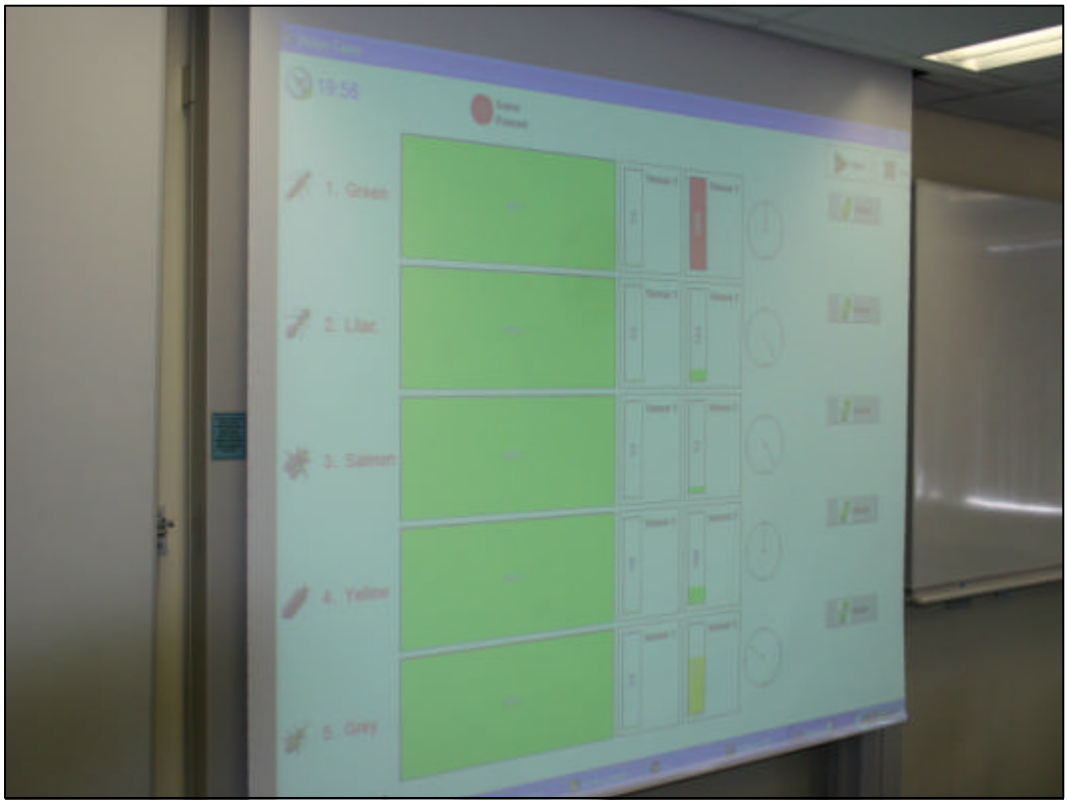

The game play

sOC-EUSAI Grenoble 2005

Sensorium games

- ? Trove platform can be extended in a number of directions without changing the underlying system design
 - More sensors/combinations
 - Locationing
 - Collaborative/disruptive cluster interaction
 - Adaptive behaviour

sOC-EUSAI Grenoble 2005

What's next

- ? Open source the platform
- ? Learn more about game play possibilities
- ? More interactive (better mote technology)
- ? Games vs. teaching
- ? Combine with virtual/augmented reality

sOC-EUSAI Grenoble 2005

Thank you.
